

Coding in an AI World - Agenda notebook

DSC 482 - Lyon College - Spring 2026

Preview and discussion: Literature Review (2nd sprint) 45 min

Discuss with your neighbor, then come up with an answer

1. What does "2nd sprint" mean to you?

- A sprint is a period of 2-4 weeks in an **agile Scrum** project.
- During the sprint, teams work on the backlog of all the things they need to do to build a successful **prototype** for shipping.
- In the sprint **review** at the end of each sprint, the team presents their prototype to the client and the other teams for review.
- The main purpose of the review is to solicit comments and get input for the next sprint.

2. Has your project confidence index changed?

- If it went up from where it was 3 weeks ago, you can relax.
- If it went down from where it was 3 weeks ago, you have to make

changes so that you bring it back to at least a 5 (50%) or better.

3. What counts as a good source?

1. **Recent** (depending on quality/field) but not too recent (unchecked)
2. **Citations** (other publications referring to the source)
3. Authors' **reputation** (indirectly or directly)
4. **Style** and **tone** of the publication (journalistic/commercial)
5. **Place of publication** (science, commerce, independent)
6. **Relevance** for your topic (you can **use** it)
7. Realistically **doable** (you can **understand** it)
8. **Structure** of the publication (you can summarize it)
9. **Evidence** (references inside the source)
10. **Purpose** (**bias** of the source)

4. How can you evaluate a source?

1. **Identify** the author and place of publication.
2. Check **when** it was published or last updated.
3. Look for evidence: data, **references**, or links to other work.
4. **Compare** the claims with at least one or two other sources.
5. Ask what the **purpose** of the source is (inform, argue, sell, persuade).
6. Check whether the claims are specific and supported, or vague and opinion-based.
7. Decide whether the source actually helps answer your research question.
8. Read the first sentence
9. Check if authors have titles (expertise)
10. Check if the title is meaningful
11. Check if there are conclusions and if they are honest.

5. How can you move from your proposal to a step-by-step plan?

1. **Restate** your project goal in one clear sentence.
2. Identify the main **inputs** (information, tools, or data you need).
3. Break the task into major stages (research, design, testing, evaluation).
4. Turn each stage into **concrete actions** you can perform.
5. Put the actions in a **logical** order.
6. Add simple **checks** to verify whether each step worked.
7. Write the plan so **another** person could follow it without guessing.

Now: Two questions from everyone on their project.

1. Can I use videogames as my sources (yes)
2. Should I reference data that I am using (yes)
3. Can I use someone's opinion (yes, if it can be validated)
4. Besides input for my agent, do I need any other sources? (Yes: e.g. sources that did the same thing, or external evaluators that can judge the quality of the output).
